MOBILE PRODUCT (FLUTTER FIELD-SERVICE COMPANION)

ServiceBolt App: A Worker Companion for Tickets, Quotes, and Invoices in the Field

A detailed case study on the Google Play companion app for ServiceBolt workers. The Play Store listing states that technicians can manage assigned support tickets, generate quotes, and create invoices for client work. Mediusware's Flutter portfolio describes the same product family with job boards, GPS dispatch, photo uploads, status updates, and offline-first field patterns.

PRODUCT	MARKET	STATUS
ServiceBolt on Google Play (package com.servicebolt.app). Listing updated 23 Oct 2026.	Field-service businesses, dispatch offices, and on-site technicians	Live on Google Play; companion to the ServiceBolt web product

THE STORY IN ONE MINUTE

Office software only works if the technician can finish the job on a phone

ServiceBolt already runs as a field-service platform on the web. The Android companion exists so workers can act on assigned tickets away from a desk: open the job, prepare a quote, and raise an invoice for the client. The Flutter portfolio adds the field reality around that listing: dispatch context, photo proof, status changes, and work that must survive weak connectivity.

EVIDENCE BOUNDARY

Ticket, quote, and invoice language comes from the Play Store "About this app" text. Job board, GPS, photo, status, and offline language comes from Mediusware's Flutter portfolio write-up. Install counts, ratings breakdowns, and SLA metrics are not used here.

CLASSIFICATION

Category:	Flutter Android companion for a field-service operations platform
Audiences:	Technicians in the field, office dispatchers, and service business owners
Core promise:	Assigned work can be progressed to quote and invoice without returning to a desktop
Live link:	https://play.google.com/store/apps/details?id=com.servicebolt.app&hl;=en

MARKET PROBLEM

Field Work Breaks When the System Stays on a Desktop

The listing and portfolio together point to a familiar field-service gap: the office can create work, but the person on site still needs to update tickets, price the job, and bill the client before they leave.

WHERE FIELD SERVICE APPS FAIL

01
Work stays in the office
Tickets live on a desktop the technician cannot reach on site.

02
Quotes wait until later
Pricing is postponed, so cash and follow-up slip.

03
Invoices lag the visit
Billing happens after the van leaves, and details get fuzzy.

04
No proof from the site
Photos and status changes never make it back cleanly.

05
Weak signal
Basements and rural jobs drop connectivity mid-update.

06
Two systems drift
Mobile notes and the office platform stop matching.

THE FIELD SERVICE LOOP

01	02	03	04	05	06
Assign	**Arrive**	**Document**	**Price**	**Bill**	**Sync**
Ticket to worker	Open job on phone	Photos, notes	Quote on site	Invoice client	Office sees status

PRODUCT PRINCIPLE

Put ticket, quote, and invoice actions where the work happens, and keep the companion honest about being a worker app for an existing ServiceBolt platform, not a standalone ERP.

THE BUSINESS CHALLENGE

Make the Companion Useful on Site Without Losing Office Control

The app has to be fast for a technician with dirty gloves and a short visit window, while still writing clean records back to the ServiceBolt system the office already trusts.

SIX PRODUCT CHALLENGES

01
Assigned work only
Workers need their tickets, not the whole company inbox.

02
Quote while present
Pricing must be possible before the client walks away.

03
Invoice without delay
Billing should follow the completed visit.

04
Field evidence
Photos and status must attach to the right job.

05
Offline tolerance
Updates should queue when the signal drops.

06
One product family
Android UX must stay aligned with ServiceBolt web.

TWO AUDIENCES

SERVICEBOLT WORKERS
Execute on site
Want assigned tickets, quotes, invoices, and clear job status on Android.

OFFICE / DISPATCH
Plan and follow up
Want the companion to update the same jobs the web platform already tracks.

COMMERCIAL MODEL

The Play Store page presents a free-listed companion for ServiceBolt workers, with support contacts for ServiceBolt LLC in Lexington, KY. Plan names and seat pricing for the parent platform are not shown on the app listing, so they are not claimed here.

THE PLATFORM SOLUTION

A Flutter Companion Wired to ServiceBolt Field Operations

The public listing defines the worker jobs. The Flutter portfolio describes how those jobs are packaged for phones: one Dart codebase, store distribution, and field-oriented capabilities around the ticket lifecycle.

THE CORE FLOW

01	02	03	04	05	06
Receive	**Work**	**Prove**	**Price**	**Bill**	**Sync**
Assigned ticket	Update on site	Photos / status	Generate quote	Create invoice	Back to office

CAPABILITIES NAMED IN THE EVIDENCE

01
Support tickets
Manage assigned tickets (Play Store).

02
Quotes
Generate quotes for client work (Play Store).

03
Invoices
Create invoices after service (Play Store).

04
Job boards
See field work queues (Flutter portfolio).

05
GPS dispatch
Location-aware field context (Flutter portfolio).

06
Offline-first posture
Keep working when signal is weak (Flutter portfolio).

FACTS AT CAPTURE

3	1	1	23 Oct 2026
Worker actions named on Play Store	Public Android package	Parent web product	Listing last updated

WHAT THE EVIDENCE SHOWS

Counting the Public Proof, and the Claims to Keep Separate

The Play Store page is concrete on worker jobs and sparse on screenshots of every flow. The Flutter portfolio is concrete on field patterns and does not replace the store listing as the installable proof.

ELEMENTS COUNTED IN THE PUBLIC SOURCES

3	4	3	4	1	1
Worker actions	Data-safety statements	Support channels	Portfolio field patterns	Store package	Parent product

OBSERVATIONS

- The Play Store text names tickets, quotes, and invoices. It does not, by itself, document GPS dispatch or offline queues. Those appear in the Flutter portfolio and should be labeled as portfolio context unless shown in the live build on a call.
- The developer data-safety form says no data shared with third parties, no data collected, encryption in transit, and that data cannot be deleted. Those are store declarations, not a full security audit.
- The listing positions the app as a companion for ServiceBolt workers. Treating it as a full standalone field ERP would over-claim what the store page supports.
- Support shows a website, phone, and serviceboltdev@gmail.com under ServiceBolt LLC in Lexington, KY. That is product ownership evidence, not Mediusware delivery staffing.

DESIGN PRINCIPLE

Show the technician completing one ticket-to-invoice path on a device. Short screen recordings beat adjectives like seamless or powerful.

TECHNOLOGY AND ARCHITECTURE

Flutter Delivery Behind a Store-Listed Field Companion

The Play Store does not publish the stack. Mediusware's Flutter portfolio places ServiceBolt in a Flutter/Dart delivery set with Firebase-side mobile services, geolocation, and store distribution. The grouping below separates what is stated from what must still be confirmed on a walkthrough.

ARCHITECTURE AS STATED OR IMPLIED

01
Flutter client
Dart codebase aimed at Android store delivery.

02
Worker job APIs
Tickets, quotes, and invoices against ServiceBolt.

03
Dispatch context
GPS-assisted field orientation (portfolio).

04
Media capture
Photo uploads tied to jobs (portfolio).

05
Sync posture
Offline-tolerant updates (portfolio).

06
Store release
Google Play package com.servicebolt.app.

METHODS AND TOOLS NAMED

Flutter | Dart | Firebase | Geolocation | Secure storage patterns | FCM / push | Play Store | REST / API sync

CLAIM BOUNDARY

Stack names come from Mediusware portfolio mapping for this app family. Confirm API contracts, offline conflict rules, exact Firebase products in use, and whether iOS is in scope before describing the system as fully multi-platform.

REPORTED RESULTS AND INTENDED VALUE

What the Listing Implies, and What Remains Unmeasured

Public sources support product intent. They do not publish completion rates, quote-to-invoice conversion, or offline sync success.

INTENDED VALUE, PER THE EVIDENCE

01
Fewer desk returns
Workers can progress tickets on site.

02
Faster commercial close
Quotes and invoices while the visit is fresh.

03
Cleaner office records
Status and media tied to the job.

04
Dispatch awareness
Location context for field routing.

05
Resilience
Work continues when signal is poor.

06
Store distribution
Android crews can install from Play.

USAGE SCENARIOS IMPLIED

- A technician opens an assigned support ticket on arrival, captures photos, and updates status before leaving the site.
- The same worker generates a quote while the customer is present, then creates an invoice after the work is accepted.
- Dispatch uses the parent ServiceBolt platform while the companion keeps the field record aligned through sync.

CLAIM BOUNDARY

Value is inferred from named features. Publish time-to-invoice, offline sync success, and ticket completion after device demos and production telemetry, not before.

MEDIUSWARE CONTRIBUTION AND DELIVERY EVIDENCE

Engineering Surfaces Behind a Field-Service Companion

Mediusware presents ServiceBolt in its Flutter portfolio as a live store app. Exact sprint ownership, contract dates, and module-level authorship should still be confirmed before any public "we built X" claim beyond portfolio demonstration rights.

SURFACES TO ATTRIBUTE

01
Flutter app shell
Navigation, auth session, job lists.

02
Ticket workflows
Assigned work detail and updates.

03
Commercial actions
Quote and invoice entry points.

04
Field capture
Photos, status, location context.

05
Sync and resilience
Offline queue and retry behavior.

06
Store release
Play packaging and listing readiness.

DEFENSIBLE PUBLIC PROOF

PROOF
3
Worker actions
Named on Play Store

PROOF
1
Live package
com.servicebolt.app

PROOF
4
Field patterns
Named in Flutter portfolio

PROOF
1
Update date
23 Oct 2026 on listing

CONTRIBUTION BOUNDARY

The live app and portfolio mention are public. Staffing, IP schedule, and which modules Mediusware owns versus the client team are not on the Play Store page. Record those before broader authorship claims.

VERIFICATION AND COMPLIANCE

Confirm the Companion Before It Is Shown as Production-Critical

A worker app that touches tickets, quotes, and invoices affects money and customer trust, so demos should stay inside verified facts.

PRE-PUBLICATION VERIFICATION

01
Install the listing
Open com.servicebolt.app from Play and sign in with a demo worker.

02
Trace one job
Ticket to quote to invoice on a real device.

03
Check permissions
Camera, location, and notifications only where used.

04
Review data safety
Reconcile the store form with actual API traffic.

05
Offline test
Airplane mode mid-update, then sync.

06
Authorship file
Confirm Mediusware scope and client permission to demo.

MEASURES WORTH PUBLISHING

- Median minutes from ticket open to quote sent on device
- Share of jobs with at least one on-site photo attached
- Offline queue success rate after reconnect
- Crash-free sessions for the current Play release

GOVERNANCE PRIORITY

Publish outcomes only after device verification and written demo rights. A traceable record of scope, test notes, and store declarations keeps every later claim defensible.

MEDIUSWARE

Build Field Companions That Finish the Job Where the Work Happens

This project shows how a live Play Store worker app, a clear companion relationship to ServiceBolt, and disciplined evidence make a stronger field-service demo than screenshots alone.

WHAT THE PROJECT DEMONSTRATES

01
Ship a real listing
Installable Android proof.

02
Name worker jobs
Tickets, quotes, invoices.

03
Keep the parent clear
Companion, not a second ERP.

04
Design for the van
One-hand flows on site.

05
Respect weak signal
Offline-tolerant updates.

06
Attach evidence
Photos and status on the job.

07
Bound the claims
Store text versus portfolio.

08
Verify before scale
Device path and permissions.
